1. You are standing at x =9.0 km and your assistant is standing at x = 3.0 km. Lightning Bolt 1 strikes at x = 0 km and Lightning Bolt 2 strikes at x = 12.0 km. You see the flash from bolt 2 at t = 10 μs and the flash from bolt 1 at t = 50 μs. **According to your assistant, are the strikes simultaneous?** To help you answer this, do the following:

A. Draw this scenario

B. Add a second calibrated x-axis below the first, this time in μls.

C. What are the coordinates of the two events A and B, whenwhere you record the flashes from the strikes arriving?

D. What are the coordinates of the two events C and D, whenwhere the two strikes actually happened?

E. What are the coordinates of the two events E and F, whenwhere your assistant records the flashes from the strikes arriving?
